. Past , enter at the field right of .

Uniform magnitude , into the page; all is in vacuum.
Define the Cartesian axes shown with origin :
; boundary is parallel to the axis. At ,
open , together, admitting to ; at , close
to stop entry to ; at close , stopping

entry to . The fastest particle from passes point
, at . For the slowest particle entering at
also to pass , where in plane must be
shifted parallel to itself?

6. Shown: blocks on a smooth level table,

all of mass . spring: natural length , stiffness ;
are joined by a spring of natural length , stiffness .
Their centres are collinear. collisions are perfectly
elastic and brief. Both springs start at natural
length. rest; move right at velocity .
Discuss their motion quantitatively.
: how do all four move relative to the table?
: how do all four move relative to the table?
